Section 1: Introduction

The relay data communication facility is compatible with control and automation systems and PCs running Reydisp software. The relay can provide operational information, post-fault analysis, settings interrogation and editing facilities. This section describes how to use the Communication Interface with a control system or interrogating computer. Appropriate software within the control system or on the interrogating computer (e.g. Reydisp Evolution) is required to access the interface.

This section specifies connection details and lists the events, commands and measurands available. For further information regarding the IEC60870-5-103 interface, reference should be made to the separate Informative Communications Interface manual.

The Communications Interface for dialogue communications by the Protection Engineer is provided by the Reydisp Evolution software package, also available from the website, using the IEC60870-5-103 protocol.

Section 2: Physical Connection

The relay range provides one 'Front' USB communication interface (Com2) located on the fascia and one RS485 (Com1) located on the 'Rear'. Access to the communication settings for the USB port is only available from the relay front fascia via the key pad setting menu **COMMUNICATIONS MENU**. The communication settings for the RS485 port are available from the relay front fascia via the key pad setting menu or through Reydisp via the USB connection.

1. Com2-USB: this port is used for IEC60870-5-103 (default setting) communication with the Reydisp software. An ASCII protocol, the main use of which is to allow firmware to be updated from the front connection, is also available through this port.
2. Com1-RS485: this port can be used for IEC60870-5-103 or MODBUS RTU or DNP 3.0 communications to a substation SCADA or integrated control system or engineer remote access.

The ports can be independently mapped to the IEC60870-5-103 or MODBUS RTU or DNP3.0 protocol or switched OFF in the relay settings. The same protocol can be used simultaneously on both ports.

SPDL can provide a range of interface devices, please refer to product portfolio catalogue.

Full details of the interface devices can be found by referring to the website www.siemens.com/energy.

2.1 Communication ports

2.1.1 USB Interface

The USB communication port is connected using a standard USB cable with a type B connection to the relay and type A to the PC.

The PC will require a suitable USB driver to be installed, this will be carried out automatically when the Reydisp software is installed. When the Reydisp software is running, with the USB cable connected to a device, an additional connection is shown in the Reydisp connection window, connections to the USB port are not shown when they are not connected.

The USB communication interface on the relay is labelled Com 2 and its associated settings are located in the Data communications menu. When connecting to Reydisp using this connection the default settings can be used without the need to first change any settings, otherwise the Com 2 port must be set to IEC60870-5-103 (the relay address and baud rate do not need to be set).

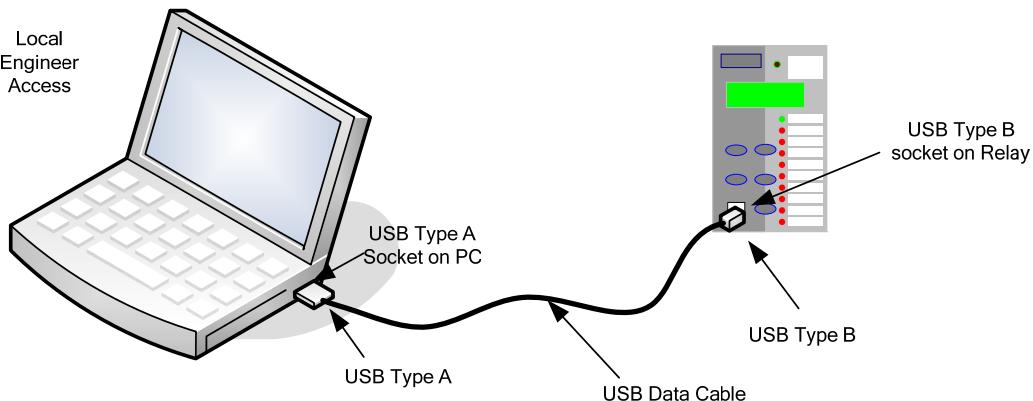

Figure 6-1 Communication to Front USB Port

RS485 Interface

The RS485 communication port is located on the rear of the relay and can be connected using a suitable RS485 120 ohm screened twisted pair cable.

The RS485 electrical connection can be used in a single or multi-drop configuration. The RS485 master must support and use the Auto Device Enable (ADE) feature. The last device in the connection must be terminated correctly in accordance with the master device driving the connection. The relays are fitted with an internal terminating resistor which can be connected between A and B by fitting an external wire loop between terminals 18 and 20 on the power supply module.

The maximum number of relays that can be connected to the bus is 64.

The following settings must be configured via the relay fascia when using the RS485 interface. The shaded settings are only visible when DNP3.0 is selected.

Setting name	Range	Default	Setting	Notes
Station Address	0 ... 254 (IEC60870-5-103) 0 ... 247 (MODBUS) 0 ... 65534 (DNP3)	0	1...	An address must be given to identify the relay. Each relay must have a unique address.
COM1-RS485 Protocol	OFF, IEC60870-5-103, MODBUS-RTU, DNP3.0	IEC60870-5-103	As Required	Sets the protocol used to communicate on the RS485 connection.
COM1-RS485 Baud Rate	75 110 150 300 600 1200 2400 4800 9600 19200 38400	19200	As Required	The baud rate set on all of the relays connected to the same RS485 bus must be the same as the one set on the master device.
COM1-RS485 Parity	NONE, ODD, EVEN	EVEN	As Required	The parity set on all of the relays connected to the same RS485 bus must be the same and in accordance with the master device.
COM1-RS485 Mode	Local, Remote, Local Or Remote	Remote	Remote	Selects whether the port is Local or Remote.
Unsolicited Mode	DISABLED ENABLED	DISABLED	As Required	Setting is only visible when COM1 Protocol is set to DNP3
Destination Address	0 ... 65534	0	As Required	Setting is only visible when COM1 Protocol is set to DNP3

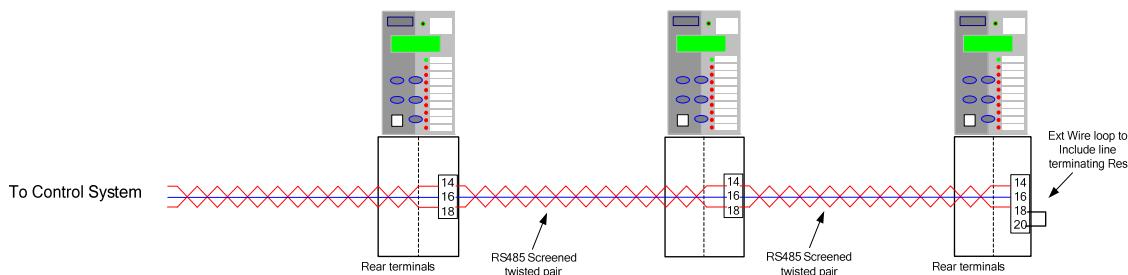

Figure 6-2 Communication to Multiple Devices from Control System using RS485

Section 3: IEC 60870-5-103 Definitions

3.1 Introduction

This section describes the IEC 60870-5-103 protocol implementation in the relays. This protocol is used for the communication with Reydisp software and can also be used for communication with a suitable control system. The control system or local PC acts as the master in the system with the relay operating as a slave responding to the master's commands. The implementation provides event information, time synchronising, commands and measurands and also supports the transfer of disturbance records.

This protocol can be set to use any or all of the relays hardware interfaces and is the standard protocol used by the USB port. The relay can communicate simultaneously on all ports regardless of protocol used.

Each relay must be given an address to enable communication and can be set by the *Communication Interface: Relay Address*. A relay with the default address of **0** will not be able to communicate.

Cause of Transmission

The cause of transmission (COT) column of the 'Information Number and Function' table lists possible causes of transmission for these frames. The following abbreviations are used:

Abbreviation	Description
SE	spontaneous event
T	test mode
GI	general interrogation
Loc	local operation
Rem	remote operation
Ack	command acknowledge
Nak	Negative command acknowledge

Note: Events listing a GI cause of transmission can be raised and cleared; other events are raised only.

ASDU Type

Abbreviation	Description
1	Time tagged message (monitor direction)
2	Time tagged message (relative time) (monitor direction)
3.1	Measurands I
4	Time-tagged measurands with relative time
5	Identification message
6	Time synchronisation
7	General Interrogation Initialization
9	Measurands II
20	General command

Information Number and Function

The following table lists information number and function definitions together with a description of the message and function type and cause of transmission that can result in that message. The table shows all events available from the relay range.

Note that not all events are available on all relay models.

Function	Information Number	Description	ASDU Type	Cause of Transmission
60	4	Remote Mode	1	SE, GI
			20	Ack, Nak

Section 4: Modbus Definitions

4.1 Introduction

This section describes the MODBUS-RTU protocol implementation in the relays. This protocol is used for communication with a suitable control system.

This protocol can be set to use the RS485 port. The relay can communicate simultaneously on all ports regardless of protocol used.

Each relay must be given an address to enable communication and can be set by the *Communication Interface:Relay Address*.

Note that not all definitions are available on all relay models.

Coils (Read Write Binary values)

1) FP_32BITS_3DP: 2 registers - 32 bit fixed point, a 32 bit integer containing a value to 3 decimal places e.g. 50000 sent = 50.000

2) Sequence of 8 registers containing an event record. Read address 30002 for 8 registers (16 bytes), each read returns the earliest event record and removes it from the internal store. Repeat this process for the number of events in the register 30001, or until no more events are returned. (the error condition exception code 2)

3) UINT16: 1 register - standard 16 bit unsigned integer

4) UINT32: 2 registers - 32bit unsigned integer

5) BITSTRING: Sequence of bits showing the status of 1-16 items. For example, if 9 inputs are used, bits 1-9 show the status of inputs 1-9 respectively. Unused bits are set to zero.

Holding Registers (Read Write values)

Address	Description
40001	Time Meter

Event Record

MODBUS does not define a method for extracting events; therefore a private method has been defined based on that defined by [4] IEC60870-5-103.

Register 30001 contains the current number of events in the relays event buffer. Register 30002 contains the earliest event record available. The event record is 8 registers (16 bytes) of information, whose format is described below. When this record has been read it will be replaced by the next available record. Event records must be read completely; therefore the quantity value must be set to 8 before reading. Failing to do this will result

in an exception code 2. If no event record is present the exception code 2 will be returned. The event address should be polled regularly by the master for events.

Event Format

The format of the event record is defined by the zero byte. It signifies the type of record which is used to decode the event information. The zero byte can be one of the following.

Type	Description
1	Event
2	Event with Relative Time
4	Measurand Event with Relative Time

Section 5: DNP3.0 Definitions

5.1 Device Profile

The following table provides a “Device Profile Document” in the standard format defined in the DNP 3.0 Subset Definitions Document. While it is referred to in the DNP 3.0 Subset Definitions as a “Document,” it is in fact a table, and only a component of a total interoperability guide. The table, in combination with the Implementation Table in Section 5.2 and the Point List Tables provided in Section 5.3 should provide a complete configuration/interoperability guide for communicating with a device implementing the Triangle MicroWorks, Inc. DNP 3.0 Slave Source Code Library.

DNP V3.0 DEVICE PROFILE DOCUMENT (Also see the DNP 3.0 Implementation Table Section 5.2.)	
Vendor Name: Siemens Protection Devices Ltd.	
Device Name: 7SR1 , using the Triangle MicroWorks, Inc. DNP3 Slave Source Code Library, Version 3.	
Highest DNP Level Supported:	Device Function:
For Requests: Level 3 For Responses: Level 3	<input type="checkbox"/> Master <input checked="" type="checkbox"/> Slave
Notable objects, functions, and/or qualifiers supported in addition to the Highest DNP Levels Supported (the complete list is described in the attached table):	
For static (non-change-event) object requests, request qualifier codes 07 and 08 (limited quantity), and 17 and 28 (index) are supported. Static object requests sent with qualifiers 07, or 08, will be responded with qualifiers 00 or 01.	
16-bit, 32-bit and Floating Point Analog Change Events with Time may be requested. Analog Input Deadbands, Object 34, variations 1 through 3, are supported. Output Event Objects 11, 13, are supported.	
Maximum Data Link Frame Size (octets):	Maximum Application Fragment Size (octets):
Transmitted: 256 Received 256	Transmitted: 2048 Received 2048
Maximum Data Link Re-tries:	Maximum Application Layer Re-tries:
<input type="checkbox"/> None <input checked="" type="checkbox"/> Fixed (3) <input type="checkbox"/> Configurable from 0 to 65535	<input checked="" type="checkbox"/> None <input type="checkbox"/> Configurable
Requires Data Link Layer Confirmation:	
<input checked="" type="checkbox"/> Never <input type="checkbox"/> Always <input type="checkbox"/> Sometimes <input type="checkbox"/> Configurable as: Never, Only for multi-frame messages, or Always	
Requires Application Layer Confirmation:	
<input type="checkbox"/> Never <input type="checkbox"/> Always <input checked="" type="checkbox"/> When reporting Event Data (Slave devices only) <input checked="" type="checkbox"/> When sending multi-fragment responses (Slave devices only) <input type="checkbox"/> Sometimes <input type="checkbox"/> Configurable as: “Only when reporting event data”, or “When reporting event data or multi-fragment messages.”

Attach explanation if 'Sometimes' or 'Configurable' was checked for any operation.

Reports Binary Input Change Events when no specific variation requested:

- Never
- Only time-tagged
- Only non-time-tagged
- Configurable to send one or the other**

Reports time-tagged Binary Input Change Events when no specific variation requested:

- Never
- Binary Input Change With Time
- Binary Input Change With Relative Time
- Configurable**

Sends Unsolicited Responses:

- Never
- Configurable**
- Only certain objects
- Sometimes (attach explanation)
- ENABLE/DISABLE UNSOLICITED Function codes supported**

Sends Static Data in Unsolicited Responses:

- Never**
- When Device Restarts
- When Status Flags Change

No other options are permitted.

5.2 Implementation Table

The following table identifies which object variations, function codes, and qualifiers the Triangle MicroWorks, Inc. DNP 3.0 Slave Source Code Library supports in both request messages and in response messages. For static (non-change-event) objects, requests sent with qualifiers 00, 01, 06, 07, or 08, will be responded with qualifiers 00 or 01. Requests sent with qualifiers 17 or 28 will be responded with qualifiers 17 or 28. For change-event objects, qualifiers 17 or 28 are always responded.

In the table below, text shaded as **00, 01 (start stop)** indicates Subset Level 3 functionality (beyond Subset Level 2).

In the table below, text shaded as **07, 08 (limited qty)** indicates functionality beyond Subset Level 3.

OBJECT			REQUEST (Library will parse)		RESPONSE (Library will respond with)	
Object Number	Variation Number	Description	Function Codes (dec)	Qualifier Codes (hex)	Function Codes (dec)	Qualifier Codes (hex)
1	0	Binary Input – Any Variation	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited qty) 17, 27, 28 (index)

OBJECT			REQUEST (Library will parse)		RESPONSE (Library will respond with)	
Object Number	Variation Number	Description	Function Codes (dec)	Qualifier Codes (hex)	Function Codes (dec)	Qualifier Codes (hex)
101	1	Small Packed Binary-Coded Decimal				
101	2	Medium Packed Binary-Coded Decimal				
101	3	Large Packed Binary-Coded Decimal				
		No Object (function code only)	13 (cold restart)			
		No Object (function code only)	14 (warm restart)			
		No Object (function code only)	23 (delay meas.)			
		No Object (function code only)	24(record current)			

Note 1: A Default variation refers to the variation responded when variation 0 is requested and/or in class 0, 1, 2, or 3 scans. Default variations are configurable; however, default settings for the configuration parameters are indicated in the table above.

Note 2: For static (non-change-event) objects, qualifiers 17 or 28 are only responded when a request is sent with qualifiers 17 or 28, respectively. Otherwise, static object requests sent with qualifiers 00, 01, 06, 07, or 08, will be responded with qualifiers 00 or 01. (For change-event objects, qualifiers 17 or 28 are always responded.)

Note 3: Writes of Internal Indications are only supported for index 7 (Restart IIN1-7)

5.3 Point List

The tables below identify all the default data points provided by the implementation of the Triangle MicroWorks, Inc. DNP 3.0 Slave Source Code Library.

The default binary input event buffer size is set to allow 100 events.

Note, not all points listed here apply to all builds of devices.

5.3.1 Binary Input Points

Binary Inputs are by default returned in a class zero interrogation.

Binary Input Points		
Static (Steady-State) Object Number: 1		
Change Event Object Number: 2		
Default Static Variation reported when variation 0 requested: 2 (Binary Input with flags)		
Default Change Event Variation reported when variation 0 requested: 2 (Binary Input with absolute time)		
Point Index	Name/Description	Default Change Event Assigned Class (1, 2, 3 or none)
1	Binary Input 1	2
2	Binary Input 2	2
3	Binary Input 3	2
4	Binary Input 4	2
5	Binary Input 5	2
6	Binary Input 6	2
35	Remote mode	2

Binary Input Points		
Static (Steady-State) Object Number: 1		
Change Event Object Number: 2		
Default Static Variation reported when variation 0 requested: 2 (Binary Input with flags)		
Default Change Event Variation reported when variation 0 requested: 2 (Binary Input with absolute time)		
Point Index	Name/Description	Default Change Event Assigned Class (1, 2, 3 or none)
36	Service mode	2
37	Local mode	2
38	Local & Remote	2
41	Trip Circuit Fail	2

5.3.2 Double Bit Binary Input Points

Double Bit Binary Inputs are by default returned in a class zero interrogation.

Double Bit Input Points		
Static (Steady-State) Object Number: 3		
Change Event Object Number: 4		
Default Static Variation reported when variation 0 requested: 1 (Double Bit Binary Input packed format)		
Default Change Event Variation reported when variation 0 requested: 3 (Double Bit Binary Input Event with relative time)		
Point Index	Name/Description	Default Change Event Assigned Class (1, 2, 3 or none)
0	CB 1	2

5.3.3 Binary Output Status Points and Control Relay Output Blocks

The following table lists both the Binary Output Status Points (Object 10) and the Control Relay Output Blocks (Object 12).

While Binary Output Status Points are included here for completeness, they are not often polled by DNP 3.0 Masters. It is recommended that Binary Output Status points represent the most recent DNP "commanded" value for the corresponding Control Relay Output Block point. Because many, if not most, Control Relay Output Block points are controlled through pulse mechanisms, the value of the output status may in fact be meaningless. Binary Output Status points are not recommended to be included in class 0 polls.

As an alternative, it is recommended that "actual" status values of Control Relay Output Block points be looped around and mapped as Binary Inputs. (The "actual" status value, as opposed to the "commanded" status value, is the value of the actuated control. For example, a DNP control command may be blocked through hardware or software mechanisms; in this case, the actual status value would indicate the control failed because of the blocking). Looping Control Relay Output Block actual status values as Binary Inputs has several advantages:

- it allows actual statuses to be included in class 0 polls,
- it allows change event reporting of the actual statuses, which is a more efficient and time-accurate method of communicating control values,
- and it allows reporting of time-based information associated with controls, including any delays before controls are actuated, and any durations if the controls are pulsed.

The default select/control buffer size is large enough to hold 10 of the largest select requests possible.

Binary Outputs are by default returned in a class zero interrogation.

Point Index	Name/Description	Supported Control Relay Output Block Fields
1	Binary Output 1	Pulse On/ Latch On
2	Binary Output 2	Pulse On/ Latch On
3	Binary Output 3	Pulse On/Latch Off
4	Binary Output 4	Pulse On/Latch Off
5	Binary Output 5	Pulse On/Latch Off
6	Binary Output 6	Pulse On/Latch Off
7	Binary Output 7	Pulse On/Latch Off
8	Binary Output 8	Pulse On/Latch Off
33	LED Reset	Pulse On/Latch Off
34	Settings Group 1	Pulse On/Latch Off
35	Settings Group 2	Pulse On/Latch Off
36	Settings Group 3	Pulse On/Latch Off
37	Settings Group 4	Pulse On/Latch Off
42	Auto-reclose on/off	Pulse On/Pulse Off/Latch On/Latch Off
43	Hot line working on/off	Pulse On/Pulse Off/Latch On/Latch Off
44	E/F off/on	Pulse On/Pulse Off/Latch On/Latch Off
45	SEF off/on	Pulse On/Pulse Off/Latch On/Latch Off
46	Inst Protection off/on	Pulse On/Pulse Off/Latch On/Latch Off
48	Reset CB Total Trip Count	Pulse On/Latch Off
49	Reset CB Delta Trip Count	Pulse On/Latch Off
50	Reset CB Count to AR Block	Pulse On/Latch Off
51	Reset Frequent Ops Count	Pulse On/Latch Off
53	Reset I^2t CB Wear	Pulse On/Latch Off

Point Index	Name/Description	Supported Control Relay Output Block Fields
54	CB 1	Pulse On/Pulse Off/Latch On/Latch Off
55	CB 1 Trip & Reclose	Pulse On/Latch Off
56	CB 1 Trip & Lockout	Pulse On/Latch Off

98	Reset Start Count	Pulse On/Latch On

5.3.4 Analogue Inputs

The following table lists Analog Inputs (Object 30). It is important to note that 16-bit and 32-bit variations of Analog Inputs, Analog Output Control Blocks, and Analog Output Statuses are transmitted through DNP as signed numbers.

The “Default Deadband,” and the “Default Change Event Assigned Class” columns are used to represent the absolute amount by which the point must change before an analog change event will be generated, and once generated in which class poll (1, 2, 3, or none) will the change event be reported.

The default analog input event buffer size is set 30.

Analog Inputs are by default returned in a class zero interrogation.

Analog Inputs						
Static (Steady-State) Object Number: 30						
Change Event Object Number: 32						
Default Static Variation reported when variation 0 requested: 2 (16-Bit Analog Input with Flag)						
Default Change Event Variation reported when variation 0 requested: 4 (16-Bit Analog Change Event with Time)						
Point #	Default Class	Default Static Variant	Default Event Variant	Name	Scaling Factor	Deadband
0	3	2	4	Frequency	100.0	1
1	3	2	4	Vab Primary	0.001	1000
2	3	2	4	Vbc Primary	0.001	1000
3	3	2	4	Vca Primary	0.001	1000

5.3.5 Binary Counters

The following table lists the Counters (Object 20).

The “Default Deadband,” and the “Default Change Event Assigned Class” columns are used to represent the absolute amount by which the point must change before a Counter change event will be generated, and once generated in which class poll (1, 2, 3, or none) will the change event be reported.

Counters are by default not returned in a class zero interrogation.

Counters						
Static (Steady-State) Object Number: 20						
Change Event Object Number: 22						
Default Static Variation reported when variation 0 requested: 5 (32-Bit Counter without Flag)						
Default Change Event Variation reported when variation 0 requested: 1 (32-Bit Change Event with Flag)						
Point #	Default Class	Default Static Variant	Default Event Variant	Name	Deadband	
0	3	5	1	Waveform Records	1	
1	3	5	1	Fault Records	1	
2	3	5	1	Event Records	1	
3	3	5	1	Data Log Records	1	
4	3	5	1	Number User Files	1	
5	3	5	1	Start Count	1	
6	3	5	1	Start Count Target	1	
7	3	5	1	Active Setting Group	1	
11	3	5	1	CB Total Trip Count	1	
16	3	5	1	CB Delta Trip Count	1	
17	3	5	1	CB Count To AR Block	1	
18	3	5	1	CB Frequent Ops Count	1	
21	3	5	1	E1 Counter	1	
22	3	5	1	E2 Counter	1	
23	3	5	1	E3 Counter	1	
24	3	5	1	E4 Counter	1	

5.3.6 Frozen Counters

The following table lists the Frozen Counters (Object 21).

The “Default Change Event Assigned Class” column is used to define which class poll (1, 2, 3, or none) the change event will be reported.

Note the point number of the Frozen Counter must match that of the corresponding Counter.

Frozen Counters are by default not returned in a class zero interrogation.

Frozen Counters					
Static (Steady-State) Object Number: 21					
Change Event Object Number: 23					
Default Static Variation reported when variation 0 requested: 9 (32-Bit Counter without Flag)					
Default Change Event Variation reported when variation 0 requested: 1 (32-Bit Change Event with Flag)					
Point #	Default Class	Default Static Variant	Default Event Variant	Name	Resettable
0	2	9	1	Waveform Records	<input checked="" type="checkbox"/>
1	2	9	1	Fault Records	<input checked="" type="checkbox"/>
2	2	9	1	Event Records	<input checked="" type="checkbox"/>
3	2	9	1	Data Log Records	<input checked="" type="checkbox"/>
4	2	9	1	Number User Files	<input checked="" type="checkbox"/>
5	2	9	1	Start Count	<input checked="" type="checkbox"/>
6	2	9	1	Start Count Target	<input checked="" type="checkbox"/>
7	2	9	1	Active Setting Group	<input checked="" type="checkbox"/>
11	2	9	1	CB Total Trip Count	<input checked="" type="checkbox"/>
16	2	9	1	CB Delta Trip Count	<input checked="" type="checkbox"/>
17	2	9	1	CB Count To AR Block	<input checked="" type="checkbox"/>
18	2	9	1	CB Frequent Ops Count	<input checked="" type="checkbox"/>
21	2	9	1	E1 Counter	<input checked="" type="checkbox"/>
22	2	9	1	E2 Counter	<input checked="" type="checkbox"/>
23	2	9	1	E3 Counter	<input checked="" type="checkbox"/>
24	2	9	1	E4 Counter	<input checked="" type="checkbox"/>

Section 6: Modems

The communications interface has been designed to allow data transfer via modems. However, IEC 60870-5-103 defines the data transfer protocol as an 11 bit format of 1 start, 1 stop, 8 data and even parity, which is a mode most commercial modems do not support. High performance modems will support this mode, but are expensive. For this reason, a parity setting is provided to allow use of easily available and relatively inexpensive commercial modems. This will result in a small reduction in data security and the system will not be compatible with true IEC 60870-5-103 control systems.

6.1.1 Connecting a Modem to the Relay(s)

RS232C defines devices as being either Data Terminal Equipment (DTE) e.g. computers, or data Communications Equipment (DCE), e.g. modems, where one is designed to be connected to the other. In this case, two DCE devices (the modem and the fibre-optic converter) are being connected together, so a null terminal connector is required, which switches various control lines. The fibre-optic converter is then connected to the relay Network Tx to Relay Rx and Network Rx to Relay Tx.

6.1.2 Setting the Remote Modem

The exact settings of the modem are dependent on the type of modem. Although most modems support the basic Hayes 'AT' command format, different manufacturers use different commands for the same functions. In addition, some modems use DIP switches to set parameters, others are entirely software configured.

Before applying settings, the modem's factory default settings should be applied, to ensure it is in a known state.

Several factors must be considered to allow remote dialling to the relays. The first is that the modem at the remote end must be configured as auto answer. This will allow it to initiate communications with the relays. Next, the user should set the data configuration at the local port, i.e. baud rate and parity, so that communication will be at the same rate and format as that set on the relay and the error correction is disabled.

Auto-answer usually requires two parameters to be set. The auto-answer setting should be switched on and the number of rings after which it will answer. The Data Terminal Ready (DTR) settings should be forced on. This tells the modem that the device connected to it is ready to receive data.

The parameters of the modem's RS232C port are set to match those set on the relay, set baud rate and parity to be the same as the settings on the relay and number of data bits to be 8 and stop bits 1. Note, although the device may be able to communicate with the modem at say 19200 bps, the modem may only be able to transmit over the telephone lines at 14400 bps. Therefore, a baud rate setting on which the modem can transmit should be chosen. In this example, a baud rate of 9600 should be chosen.

As the modems are required to be transparent, simply passing on the data sent from the controller to the device and vice versa, error correction and buffering is turned off.

If possible, Data Carrier Detect (DCD) should be forced on, as this control line will be used by the Fibre-optic converter.

Finally, these settings should be stored in the modem's memory for power on defaults.

6.1.3 Connecting to the Remote Modem

Once the remote modem has been configured correctly, it should be possible to dial up the modem and make connection to the relay. As the settings on the remote modem are fixed the local modem should negotiate with it on connection, choosing suitable matching settings. If it cannot do this, the local modem should be set with settings equivalent to those of the remote modem as described above.

Section 7: Configuration

The data points and control features which are possible within the relay is fixed and can be transmitted over the communication channel(s) protocols in the default format described earlier in this section. The default data transmitted is not always directly compatible with the needs of the substation control system and will require some tailoring, this can be done by the user with the Reydisp software comms editor tool.

The Comms Editor is provided to allow its users to configure the Communications Files Protocols in Reyrolle brand Relays manufactured by Siemens Protection Devices Limited (SPDL).

The editor supports configuring DNP3, IEC60870-5-103 and MODBUS protocols.

The editor allows configuration files to be retrieved from the relay, edited, then uploaded back to the relay. Files may also be saved-loaded from disc to work offline. The protocols will be stored in a Reyrolle Protection Device Comms file (RPDC), which will be stored locally, so that the editor can be used when the relay is not connected.

DNP3

The tool will allow:

- Data Points to be enabled or disabled.
- Changing the point numbers for the Binary Inputs, Binary Outputs and Analogue Inputs.
- Changing their assigned class and object variants.
- Setting Binary points to be inverted before transmission.
- Setting the Control Relay Output Block (CROB) commands that can be used with a Binary Output.
- Specifying a dead-band outside which Analogue Events will be generated.
- Specifying a multiplier that will be applied to an analogue value before transmission.

IEC60870-5-103

The tool will allow:

- Data Points to be enabled or disabled.
- Changing the point numbers Function Type (FUN) and Information (INF), returned by each point.
- Changing the text returned to Reydisp for display in its event viewer.

MODBUS-RTU

The tool will allow:

- Changing the Addresses for the Coils, Inputs and Registers.
- Changing the format of the instrument returned in a register, e.g. 16 or 32 bit.

Note, as MODBUS points are polled they do not need to be enabled or disabled

The user can check if the relay contains user configured communication files via a meter in the relay menus. Pressing the Enter and down arrow buttons on the fascia, then scrolling down, the number of files stored in the relay is displayed. The file name can also be viewed by pressing the Cancel and Test/Reset buttons together when in the relay Instruments menu. The user must ensure when naming the file, they use a unique file name including the version number.

Please refer to the Comms Editor Technical Manual for further guidance.

Section 8: Glossary

ASDU

Application Service Data Unit.

Baud Rate

Data transmission speed.

Bit

The smallest measure of computer data.

Bits Per Second (bps)

Measurement of data transmission speed.

Data Bits

A number of bits containing the data. Sent after the start bit.

Data Echo

When connecting relays in an optical ring architecture, the data must be passed from one relay to the next, therefore when connecting in this method all relays must have the Data Echo ON.

Half-Duplex Asynchronous Communications

Communications in two directions, but only one at a time.

Hayes 'AT'

Modem command set developed by Hayes Microcomputer products, Inc.

Line Idle

Determines when the device is not communicating if the idle state transmits light.

Parity

Method of error checking by counting the value of the bits in a sequence, and adding a parity bit to make the outcome, for example, even.

Parity Bit

Bit used for implementing parity checking. Sent after the data bits.

RS232C

Serial Communications Standard. Electronic Industries Association Recommended Standard Number 232, Revision C.

RS485

Serial Communications Standard. Electronic Industries Association Recommended Standard Number 485.

Start Bit

Bit (logical 0) sent to signify the start of a byte during data transmission.

Stop Bit

Bit (logical 1) sent to signify the end

USB

Universal Serial Bus standard for the transfer of data.
